

Instructions for Using Lumato Revit Families

Type Catalogs

When downloading the files from the Revit database online, you must save the text (.txt) file in the same location as the Revit (.rfa) file. After importing the file, you will get a "Specify Types" dialog box. Moving from left to right filter out desired family type and click OK.

The small arrows at the bottom right corner of each parameter are pull down menus. Once the user has filtered down to a single type, no more filtering is required. All Type Filters correspond directly to their spec sheet ordering information.

Visibility Parameters

If creating longer runs of fixtures from 4' sections, you can turn the right or left cables off with a checked box under the visibility parameter. Select the fixture and choose this option under properties. A parameter for suspension length is also located here.
